Master Heorem

In the analysis of algorithms, the "master theorem" provides a cookbook solution in asymptotic terms (using Bigo notation) for recurrence relations of types that occur in the analysis of many divide & conquer algorithms.

for above algorithm we will write general recurrence relation

$$T(n) = a T(\frac{n}{b}) + f(n)$$
 Where $a \ge 1, b > 1$

on + is the size of the problem

End

a > is the n-of subproblems in recursion

1/b -> size of each subproblem

fin) - cost of the work done other than recursive calls.

$$T(n) = \alpha T\left(\frac{n}{b}\right) + \theta\left(n^{k} \log n\right)$$

for $a \ge 1$, b > 1, $k \ge 0$ and p is real numbers

Case 1:
$$a > b^k$$

Then $T(n) = \Theta(n^{\log a})$

a) if
$$P>-1$$
 then $T(n) = O(n^{\log n} \log n)$

b) if
$$P = -1$$
 lines $T(n) = \Theta(n^{\log 6} \log \log n)$

e) if
$$PX-1$$
 then $T(n) = O(n^{\log a})$

b) if
$$P(0)$$
 then $T(n) = O(n^k)$

Note: Not all recurrence relations can be solved by using master theolem. It is applicable when $a \ge 1$, by and f(n) is asymptotically positive function.

Fig. :
$$QT(\frac{n}{3}) + n$$

Here $a = 9$ $b = 3$ $b = 1$
 $a = b^k$ check whether $a \ge 1, b > 1, k \ge 0$
 $a = b^k$ check whether $a \ge 1, b > 1, k \ge 0$
 $a \ge b^k$ then $O(n^{\log_3 a})$
 $= O(n^{\log_3 a})$
 $= O(n^{\log_3 a})$
 $= O(n^{2})$
 $\therefore T(n) = O(n^{2})$

Fig.: $T(n) = 3T(\frac{n}{4}) + cn^2$
 $a = 3$ $b = 4$ $k = a$ $p = 0$
 $a \ge 1, b > 1, k \ge 0, p = 0$ so apply master theorem

 $a \ge 1, b > 1, k \ge 0, p = 0$ so apply master theorem

 $a \ge 1, b > 1, k \ge 0, p = 0$ so apply $a \ge 1, b \ge 1, k \ge 0$
 $a \ge 1, b \ge 1, k \ge 0, p = 0$ so $a \ge 1, b \ge 1, k \ge 0$

Master theorem Pit-Falls:

We can't use the master theorem it

$$f(n)$$
 is not a polynomial $ex: T(n) = aT(\frac{a}{a}) + \frac{a^n}{a}$

* b cannot be expressed as a constant Ex;
$$t(n) = T(\sqrt{n})$$

$$* T(n) = 2^n T(\frac{1}{2}) + m^n$$

a is not a constant

act can't have less than one sub problem

$$T(n) = 64T(\frac{n}{8}) - n^2 \log n$$

f(n) which is the combination time is not positive

$$+ T(\frac{n}{2}) + n(a-cosn)$$

$$+ T(n) = aT(\frac{n}{a}) + \frac{n}{\log n}$$

Here f(n) and nlog & can be expressed with the ratio

$$\frac{f(n)}{n^{1090}} = \frac{n(1090)}{n^{1092}} = \frac{n}{n^{1090}} = \frac{1}{1090} \quad \text{which is less}$$

$$\frac{1}{n^{1090}} = \frac{n(1090)}{n^{1090}} = \frac{n}{n^{1090}} = \frac{1}{1090} \quad \text{than } \frac{n^{100}}{n^{100}}, c>0$$

... nonpolynomial, so doesn't apply
